PREFACE.

Having all my life been in close relationship with French and English literature, the need of a Medical Dictionary in the two languages has often forced itself on my attention, and when Messrs. Baillière, Tindall and Cox suggested that such a work was urgently required, it afforded me much pleasure to undertake the task of filling the void.

In the first part (English-French) I have endeavoured as far as possible to give for each English word or term the French equivalent, when it exists, but I have found it necessary in some instances to employ a French phrase to express an English word. I have been especially careful to append the genders of French *substantives* when used alone or employed in descriptive sentences, except, of course, in those cases where the gender is clearly indicated by an accompanying adjective, article, or pronoun. Furthermore, I have thought it important to indicate the feminine of those *adjectives* in which it differs from the masculine.

The scope of this work does not allow of the introduction of any Latin, Greek, or other derivations, the insertion of which, though undoubtedly useful, would have increased the size of the book to such an extent as to render it less handy than was intended. With regard to French orthography, there seems to exist among writers a certain amount of confusion as to the employment of the *h*. For example, *Hémorragie* or *Hémorrhagie ; Ophtalmie* or *Ophthalmie ; Urétral* or *Uréthral*, etc. I have given both ways of spell-

ing, but I am inclined to think that of late French savants are more disposed to include the *h*, which is certainly more in accordance with the derivation of such words. Pathology, surgery, anatomy, and physiology are naturally included in the title of 'Medical' Terms; I have also added those biological, botanical, and zoological words that are met with in medical literature generally. Moreover, for the purpose of reference, I have considered it useful to specify the different methods of medical treatment and also the various surgical operations under the names of their respective originators.
